

Technology Infusion Working Group

**Earth Science Data Systems Working Group Meeting
November 2011
Newport News, VA**

**Working Group Co-Chairs:
Karen Moe, NASA/ESTO
Brian Wilson, NASA/JPL**

Agenda

- Mission & Scope
- Summary of Activities & Accomplishments
 - Data Stewardship
 - Process & Strategies
 - Semantic Web
 - Services, Interoperability, and Orchestration
- Breakout Session Agenda

Tech Infusion Working Group

- **Mission**

- Enable NASA's Earth Science community to reach its research, application, and education goals more quickly and cost effectively through widespread adoption of key emerging information technologies

- **Scope**

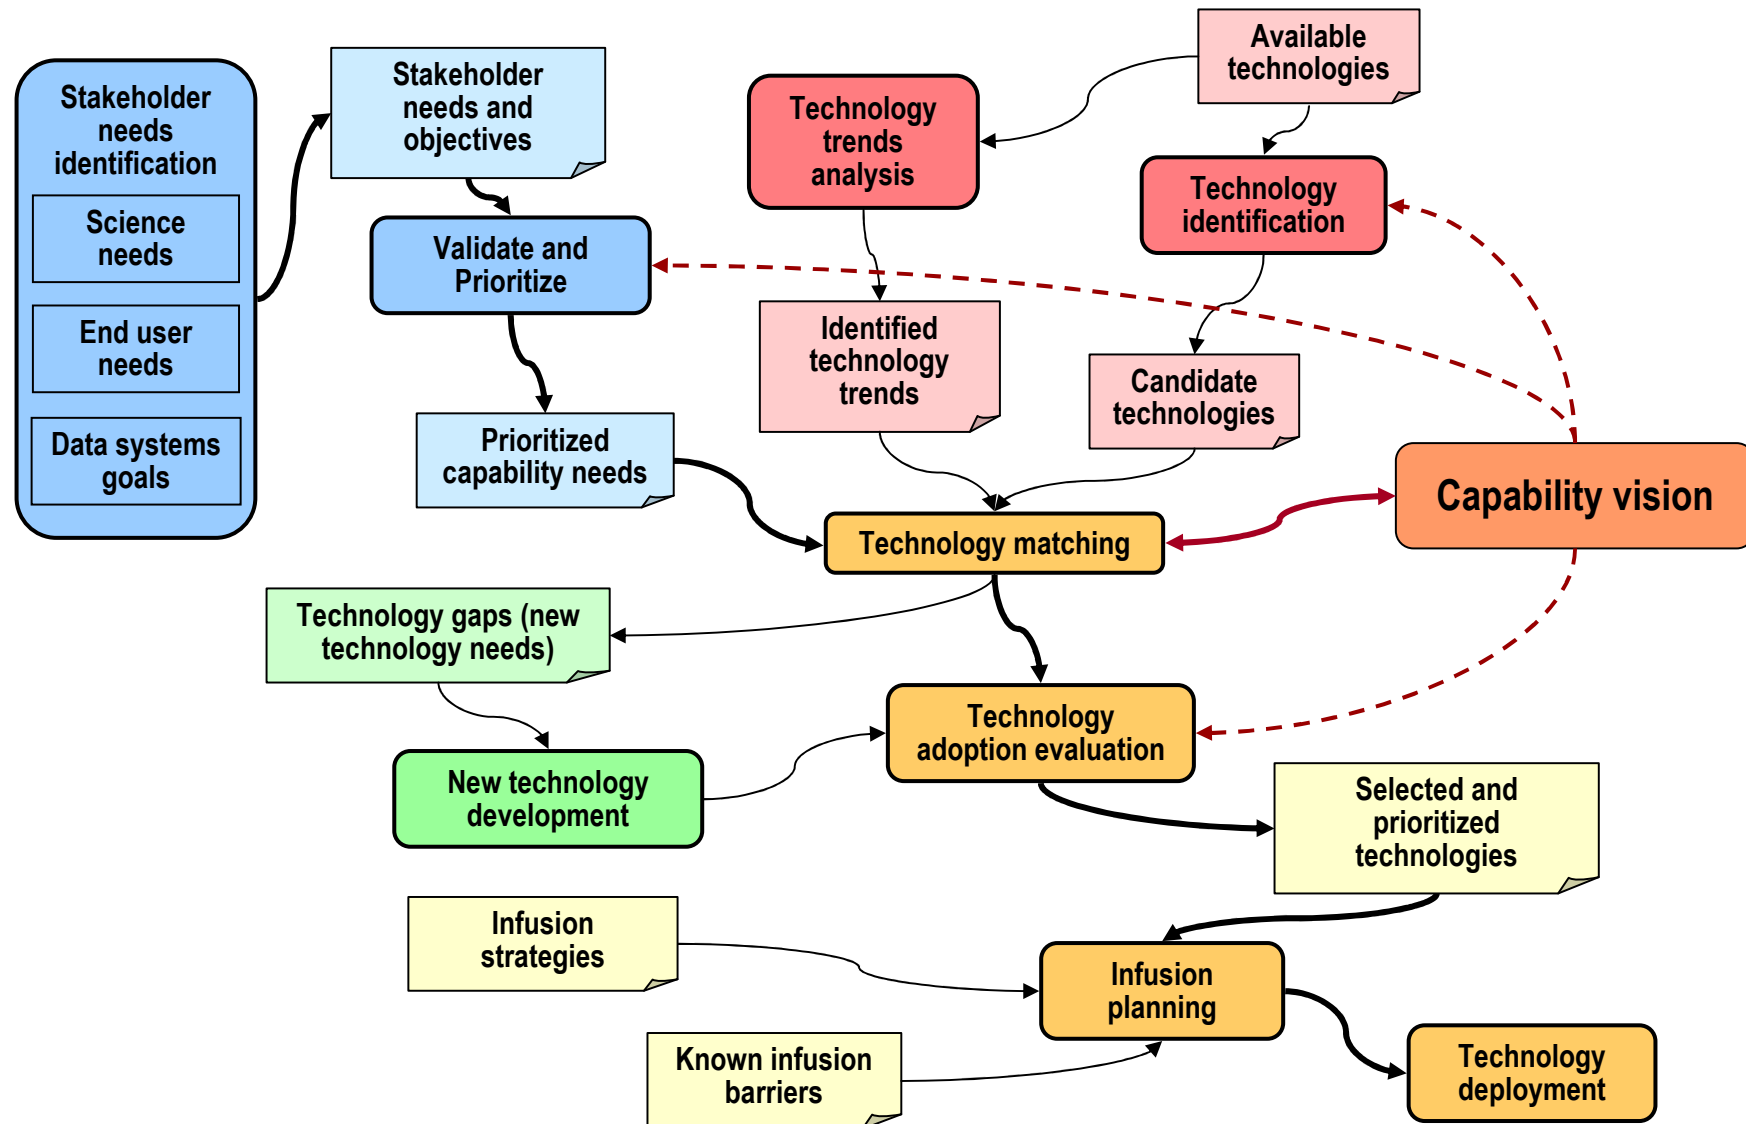

- Information technologies that...
 - Provide capabilities critical to the ESD mission & vision
 - Have been substantially developed (TRL6-9) but have not been widely deployed
 - Cannot be obtained simply through reuse of mature subsystems or software
 - May be slow to adopt because of the unique characteristics of Earth science (e.g., high data volumes)

- **Approach**

- Improve community understanding of the technology infusion process
- Identify barriers and solutions to technology adoption
- Use case studies to evaluate effectiveness of infusion processes
- Identify and evaluate new and emerging technologies
- Develop roadmaps for adoption of key technologies

Technology Infusion Process

TIWG 2011 Activities

- **Maintained 4 active subgroups areas**
 - Data Stewardship
 - Ruth Duerr (NSIDC), Curt Tilmes (GSFC)
 - Infusion Process and Strategies
 - Steve Olding (GSFC/Everware-CBDI), Joe Glassy (Lupine Logic/UMT)
 - Semantic Web
 - Brian Wilson (JPL), Mike Little (LARC) / Hook Hua (JPL)
 - Services, Interoperability, and Orchestration
 - Hook Hua (JPL), Anne Wilson (LASP)
- **Conducted weekly telecons**
 - Data Stewardship and Full Working Group (1st Thursday)
 - Process and Strategies (2nd Thursday)
 - Semantic Web (3rd Thursday)
 - Services Interoperability (4th Thursday)

Data Stewardship

Data Stewardship Subgroup

- **Completed identifiers paper**
 - "On the utility of identification schemes for digital earth science data: an assessment and recommendations"
 - Ruth E. Duerr, Robert R. Downs, Curt Tilmes, Bruce Barkstrom, W. Christopher Lenhardt, Joseph Glassy, Luis E. Bermudez and Peter Slaughter
 - DOI: 10.1007/s12145-011-0083-6
 - <http://www.springerlink.com/content/52760gg3h200gw38/>
- **Submitting UUID and DOIs to SPG**
 - Original plan to submit as standards but need 2 in-NASA ES implementations to get on the standards track
 - UUIDs to be submitted as tech note (Joe Glassy working on, based on Measures work)
 - DOI submission possibly superseded by John Moses' work to have NASA generate DOIs.
- **Developed data lifecycle technology hype cycles**
 - Identifier technologies
 - Metadata technologies
 - Data format technologies
 - Data stewardship technologies
 - Repository technologies

Hype Cycles Phases

- **"Technology Trigger"**
 - The first phase of a Hype Cycle is the "technology trigger" or breakthrough, product launch or other event that generates significant press and interest.
- **"Peak of Inflated Expectations"**
 - In the next phase, a frenzy of publicity typically generates over-enthusiasm and unrealistic expectations. There may be some successful applications of a technology, but there are typically more failures.
- **"Trough of Disillusionment"**
 - Technologies enter the "trough of disillusionment" because they fail to meet expectations and quickly become unfashionable. Consequently, the press usually abandons the topic and the technology.
 - Less visibility. More users.
- **"Slope of Enlightenment"**
 - Although the press may have stopped covering the technology, some businesses continue through the "slope of enlightenment" and experiment to understand the benefits and practical application of the technology.
- **"Plateau of Productivity"**
 - A technology reaches the "plateau of productivity" as the benefits of it become widely demonstrated and accepted. The technology becomes increasingly stable and evolves in second and third generations. The final height of the plateau varies according to whether the technology is broadly applicable or benefits only a niche market

Placement on the NASA Earth Science Hype Cycle

- **Maturity**
 - Technical completeness / operational readiness
 - 'Widespread' use in NASA production applications
- **Visibility (examples)**
 - References in conference presentations / papers
 - Number of press / journal articles
 - Inclusions in NASA proposals for funding
- **Rate of progression**
 - How to estimate projected rate of adoption?

Estimated years to mainstream adoption	
○	< 2 years
○	2-5 years
●	5-10 years
●	> 10 years
●	Obsolete before plateau
●	deprecated

- All of these as if they ended with “in the Earth Sciences”

Where adopted:

- ☐ Adoption outside of NASA ES
- ☐ Adoption in NASA Earth Science

2011 Hype Cycle for Emerging Data Format Technologies

Based on the Gartner Hype Cycle methodology, adapted by the Technology Infusion Working Group for the Earth Science community

2011 Hype Cycle for Emerging Identifier Technologies

Based on the Gartner Hype Cycle methodology, adapted by the Technology Infusion Working Group for the Earth Science community

Process and Strategies

Capability Vision for Earth Science Data Systems

- Describes 11 high-level capabilities comprising an Earth science information system capability vision
- Identifies technologies critical to achieving the vision
- Positions capabilities and technologies within a real-world scenario
- Used to develop a shared understanding of the vision within the community

Why a Capability Vision for Information Systems?

- Helps us focus our efforts
 - What capabilities are needed to achieve the Earth science goals?
 - Why?
 - What?
 - How?
- Helps
 - Why?
 - How?

Severe Weather Prediction Improvement

- Motivation
 - Hurricanes periodically hit the East Coast of the U.S., each causing dozens of deaths and billions of dollars in damage.
- Goal
 - Improve forecast accuracy from 2014 to 2020.
 - Accurate forecast of hurricane track and intensity.
- Impact
 - Better preparedness for hurricanes.
 - Note of the impact of the hurricane on the community.
- Note
 - Empower the community to take action.

Severe Weather Prediction Improvement: How Envisioned Capabilities Would Help

- Scalable analysis portals
 - Researcher can quickly create a new ocean heat flux data product for use in severe storm models.
- Community modeling frameworks
 - Several models are coupled together to create an accurate forecast the hurricane's track and associated tidal surge.
- Supporting capabilities
 - Ensure ease-of-use, quality, and timeliness.

Visuals: New heat flux data product, Refined storm track model, Accurate storm surge prediction.

- Continue to review and maintain the Capability Vision
- Updated
 - Collaboration Environments
 - Integrated Analysis Portals

Recommendations for Data Level Interoperability

- This document defines a set of pragmatic recommendations to:
 - Achieve best data interoperability.
 - Promote usability of the data.
 - Promote data transparency.
 - Promote consistency and reliability in how users identify and cite earth science datasets.
- Recommendations
 - Data and file formats
 - File names
 - Identifiers
 - Metadata
- Will be made available on earthdata.nasa.gov

TIWG Recommendations for Data Level Interoperability (2010-2011)

Goals/Objectives

Data Level interoperability involves an on-going interaction (and conversation) between Earth data producers and consumers. Ideally the practice of interoperability should include the perspective and feedback of data consumers and producers alike, not just data producers. In a NASA Decadal Survey and NASA Measures context, team members and PI's frequently occupy a mix of both roles. For example, while primarily concerned with producing a NASA Measures dataset, a typical team frequently also uses data as upstream inputs to a production process and therefore experiences firsthand both the benefits (or shortcomings) of any interoperability practices in use.

This document defines a set of pragmatic recommendations to:

- achieve best data interoperability.
- promote usability of the data. The ESDSWG provides recommendations on technologies and conventions (frequently in support of formal standards) to enhance the usability of the data we produce, as well as the services used to identify, discover, access, and process the data.
- promote data transparency, emphasizing the use of unique identifiers, and data provenance practices.
- promote consistency and reliability in how users identify and cite earth science datasets (via unique identifiers), as well as in how datasets are discovered, accessed and retrieved. For new and experienced users alike, the experience of working with Earth science data should be predictable, consistent, and ideally -- repeatable -- across diverse types and sources of data.

Decadal Survey Mission Use Cases

• Past activities

- Capture use cases for DS missions
- Analyze use cases and align with the Capability Vision
- Breakout session at 2010 summer ESIP meeting
 - TIWG DS Mission Use Case Workshop
 - Start to identify common themes and technology needs.

• Current activities

- Review use cases for general applicability as DS missions reprioritized.
- Summer ESIP meeting - Technology Infusion for the Decadal Survey Era: Data Quality Capability Needs
- Technology Infusion Analysis of DS Era Use Cases
 - Identify technology gaps and infusion opportunities
 - SIO subgroup: Seamless Data Access, Interoperable Information Services, and Collaborative Frameworks / Environments

ESDSWG Collaboration Site > TIWG Wiki

TIWG Wiki

TIWG Wiki > Decadal Survey Era Data Systems > DESDynI-L Use Cases

DESDynI-L Use Cases

Discussion with DESDynI Lidar team and users

1. Use Case: Filter data with pre-defined quality settings
2. Use Case: Annotate data products
3. Use Case: Update products
4. Use Case: Make prototype data products for validation
5. Use Case: Fuse data
6. Use Case: Find and subset data in a space-time region
7. Use Case: Infuse high performance computing technology into operational production

Infrared Flow:

1. SIPS analyst builds initial IR Target Plan using predicted ephemeris calculated from spacecraft TLE (TBC) and instrument pointing
2. IR Target Plan approved by calibration manager or IR R1 Science Working Group
3. SIPS coordinates with External Science Data Centers using Inter Calibration Exchange Protocol to acquire target data
4. SIPS queues data and runs L4 PGEs once dependencies met
5. L4 IR R1 data products archived at the ASDC
6. L4 IR data loaded into R1 database for trending and further analysis

Activity Diagram

Decadal Survey Use Cases & Common Themes

File Edit View Insert Format Data Tools Help Last edit was made 54 days ago by hook.hua

Use Case	A	B	C	D	E	F	G	H
Use Case	Scope	Notes / Generalizable	Evolvable Technical Infrastructure	Interactive Algorithm Development	Seamless Data Access	Interoperable Information Services	Responsive Information Delivery	
13. DESDynI-L Use Cases								
14. 1. Use Case: Filter data with pre-defined quality settings	users lacking expertise in specific data set; quality screening typically in science data processing (vs distribution)	Generic.				May benefit from interoperable quality screening service interface.		
15. 2. Use Case: Annotate data products	science team, discussion expanded to include all data users; archive, distribution, tbd collaborative environment	Generic.			Annotations are added later to the data. Annotations should also be seamlessly accessible with the data.		Users prefer to get data out soon. Annotations come later. How best to keep information in sync?	
16. 3. Use Case: Update products		Generic.						
17. 4. Use Case: Make prototype data products for validation		Generic.						

Semantic Web

- Semantic Web Subgroup established in 2006.
- Focus has evolved as community understanding has matured
 - Raising awareness of semantic web
 - Education on core semantic concepts and technologies
 - Practical applications of semantic technologies
- Delivered tutorials and workshops at ESDSWG and ESIP Federation meetings
 - Introduction to Semantic Web
 - Semantic Query, Rules and Knowledge Encoding
 - Semantic Web Technology
 - Practical aspects of creating semantic web applications
 - Hands-on tutorial for developing a semantic web application (Presented at the January 2011 ESIP meeting)
 - *Provenance Ontologies (ESIP 2011 Winter Meeting)*
 - *Data Life-Cycle Provenance Ontology (ESIP 2011 Summer Meeting, Joint session with Data Stewardship and Preservation Cluster)*
- Developed technology roadmaps and hype cycles to assess and track maturity of semantic technologies.
- Developing demonstrations of semantic technologies from initial proof of concept through to practical applications
 - Planned for January 2012 ESIP meeting.

Current Projects Using Semantic Web Technologies

- **Data Quality Screening Service (DQSS) – ACCESS, C. Lynnes**
 - Using ontology to select quality flags by dataset and apply expert-driven quality thresholds to satellite datasets, pixel by pixel
- **Provenance Services for a MEASUREs product – Multi-Sensor Water Vapor Climatology Stratified by Cloud Classes, ACCESS, H. Hua**
 - Capturing production provenance as logical triples in RDF format, using the Open Provenance Model (OPM) OWL ontology for interoperability
 - Provenance handling using SPARQL, Rules, and faceted search.
- **Noesis 2.0 Smart Meta-Search – R. Ramachandran, part of Service & Event Casting ACCESS project (B. Wilson)**
 - Search for relevant datasets & services across multiple back-ends: GCMD, ECHO, casts, Google, news, etc.
 - Uses ontology to expand query terms: broaden, narrow, synonyms
- **Linked Open Research Data for Earth Science Informatics – Funding Friday project, E. Rozell, T. Narock**
 - Mining AGU abstracts for links between people, papers, topics, sessions
 - Publish as Linked Open Data (LOD) on web in RDF/OWL format
- **ESIP Federation People, Skills, Collaboration Database – E. Robinson**
 - Simple ontology for people/skills/collab.; will be linked to AGU data

Services, Interoperability, and Orchestration

Cross-cutting Interoperability

- Analysis of challenges and possible solutions for complex interoperability issues
- Various interoperability dimensions:
 - Data, Metadata, Discovery, Access, Workflow, Provenance, Semantics, Infrastructure

- Example:
 - Provenance to Discovery Interoperability
- Challenges:
 - Discovery based on interoperability of metadata.
 - ISO has no place for file identifier, was suggested to put into free text.
 - Too many provenance encodings: ISO, OPM, PML, W3C Provenance

- Solutions:
 - W3C Provenance is developing a provenance interchange format. In a domain-neutral way. Takes a more open-world approach so that domain models can be made to fit. ISO has more constrained approach for domain adaptation. Has danger of becoming the overarching format.

ESDSWG TIWG: Cross-Cutting Interoperability Topics

	A	B	G	H	I	J
	Description	Workflow	Access	Workflow	Provenance	Semantics
6	Standards on workflow languages (e.g. WS-BPEL). How to integrate disparate workflow engines and formats to coordinate seamlessly.		Workflow to Access interoperability. Challenges: Solutions:	Workflow to Workflow interoperability. Challenges: 1. fragmented representation of workflows (data flow, process oriented). 2. BPEL not interoperable in practice. Solution: ws-xml was proposed by business community as interchange format.	Workflow to Provenance interoperability. Challenges: Solutions:	Workflow to Semantics interoperability. Challenges: Solutions:
7	How to ensure that provenance captured by one tool is equally understandable by another. This also relates to semantics of provenance (e.g. OPM OWL). Additionally, there is service provenance, processing provenance, and data provenance interoperability issues to address.	Provenance	Provenance to Access interoperability. Challenges: no Earth science-specific provenance storage format standard exists. Closest is ISO 19115's Lineage sections which documents mainly processing steps. OPM also has a generic model for this with OWL/RDF/XML serializations. But it needs an Earth science-specific extensions. Ideally need OPM OWL/RDF/XML and/or ISO 19115 Lineage metadata accessible such as in file form or exportable from data stores. Approach: start with something such as making OPM and/or ISO 19115 Lineage provenance information available as collocated files to the data product. Solutions:	Provenance to Workflow interoperability. Challenges: data processing steps each use and introduce new metadata to the processing pipeline. How to best manage the metadata flow? Approaches: utilize interoperable metadata for each processing step, record metadata, sequence of metadata forms lineage. can adopt to use provenance standards such as OPM. Solutions:		Provenance to Semantics interoperability. Challenges: no Earth science-specific provenance standard exists. CI 19115's Lineage sections documents mainly steps. Can leverage which is an RDF/XML provenance with some needs Earth science extensions. Approach: starting something such as and extend with Earth science context. Solutions:
8	rule sharing, 'Is my 'dataset' same as your 'data collection'?"	Semantics	Semantics to Access interoperability. Challenges: Solutions:	Semantics to Workflow interoperability. Challenges: Solutions:	Semantics to Provenance interoperability. Challenges: Solutions:	

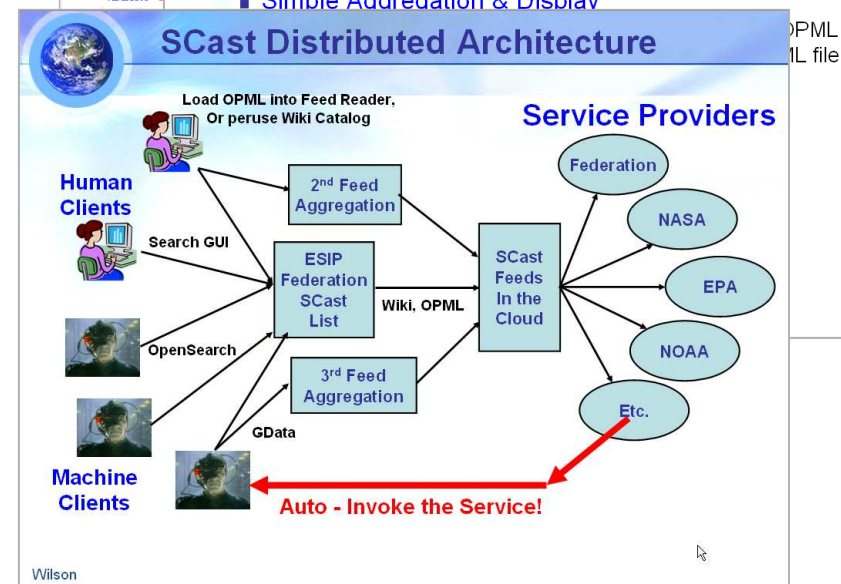

Data and Services Discovery: Casting

- Data and Service Casting
 - Lightweight, distributed alternative to centralized directories/registries
 - Easy authoring of advertisements using Atom syndication feeds
 - Providers re-publish feeds when data or services change (provider in control)
 - Scalable discovery, no single registry
 - Original service casting concept created by Brian Wilson in response to a TIWG assessment of web services registries
 - “Extended” to include granule level data casting (JPL) and collection level data casting (Ruth Duerr)

```

Service Casting Quick Summary

- Advertise bundle of Web Services via Atom Feed
 - Service Casts (scast) from many providers
 - With links pointing to callable interface (WSDL) & docs.
 - Service provider pushes new ads when services change, or periodically
- Simple Aggregation & Display

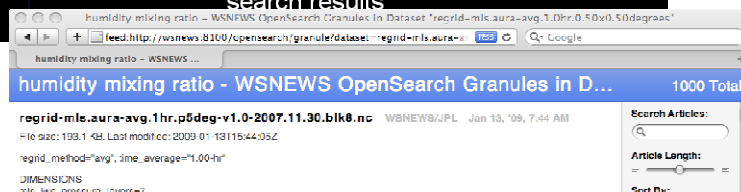

Data and Services Discovery: OpenSearch

- Federated OpenSearch
 - OpenSearch: search request/response conventions
 - Time & Space extensions
 - Simple, lightweight, widespread, extensible.

The FROST Solution

- **Federated Recursive Open-Search Tools**
 - Inventories supply search results
 - Open-Search dataset results point to open-search description docs for inventory level search
 - Off-the-shelf tools are provided to inventories to index and supply search results

Discovery History

Data and Services Discovery: Today

- Multiple Discovery implementations across different centers
 - ESIP Federated OpenSearch Services
 - GSFC, JPL, ECHO, NSIDC, UAH, GHRC, MODAPS/LAADS, WS-NEWS
 - DataCasting Services
 - JPL PO DAAC, NSIDC, UAH
 - ServiceCasting Services
 - JPL and NSIDC
 - Discovery Clients
 - GES DISC, JPL, EOSDIS, NSIDC, UAH, OMI SIPS.
- Governance process being exercised
 - DCP-1: *ESIP Discovery Cast Atom Response Format v1.1*
 - DCP-2: *Canonicalizing Granule-level OPeNDAP Links (withdrawn)*
 - DCP-3: *Standardized Linking from one cast to another or to additional metadata*
- Funded Discovery Testbed activity by ESIP Products & Services Committee
- ESIP Discovery playing key role in *Earth Science Collaboratory* vision
 - Contributed white paper to NSF EarthCube

- AGU
 - Fall 2010 AGU Meeting
 - Interoperability Barriers for Earth Science Data Systems (Hook Hua and Anne Wilson session co-conveners)
 - Information Technology Infusion Success Strategies (Brian Wilson session co-convener)
 - A Toolbox for Organization-wide Infusion of Data Systems Technologies (TIWG poster)
 - Fall 2011 Meeting
 - Interoperability Solutions in Earth Science Data Systems (Hook Hua session co-convener)

TIWG Breakout Agenda

- **#1 Planning (Tue 3:40 – 5:30 pm)**
 - Follow up to working groups restructure plan and ESDIS technology directions
- **#2 Semantic Web (Wed 8:30 – 10:35 am)**
 - Semantic web intro (20 mins)
 - Semantic web technology stack. Future tutorials and the testbed activities. (30 mins)
 - 2012 planning; organizing demos, modeling and ontology development, strategies for moving forward with semantic web. (40 mins)
 - Discovery intro; data and service casting standards (30 mins)
- **#3 Data Stewardship (Wed 10:50-12:15 pm)**
 - NASA Earth Science Data Preservation Content Specification. Rama. (20 mins)
 - What is NASA doing about identifiers and citations? (20 mins)
 - 2012 Planning session (30 mins)

TIWG Breakout Agenda

- #4 Interoperability (Wed 3:50pm - 5:30pm)
 - SIO review (20 mins)
 - Interoperability pain points - rants (30 mins).
 - 2012 planning (30 mins)
 - Splinter groups (20 mins)
 - Discussion and planning for discovery
 - Taxonomy of technologies, standards, and best practices
 - Future planning
- #5 Wrap up (Thur 8:30am – 9:30am)
 - Tech talk: webification / pomegranate (15 mins)
 - Breakout session and SIO splinter group conclusions
 - Final planning
